

Bugfix 4 - Fix Companies Dropdown issue when searching contact

In this guide I'm going to show you how to fix another issue that we have in "All Contacts" page.

If we enter a company in the *search input* then hit the companies dropdown, we'll see that it get affected by our search term.

If we go to index method inside ContactController we get the companies data from here:

```
$companies = Company::userCompanies();
```

So, to fix those issue, let's open the Company model. Go to userCompanies, then remove the SearchScope from global scope by calling withoutGlobalScope and pass its namespace.

```
public static function userCompanies()
{
    return self::withoutGlobalScope(SearchScope::class)->where('user_id',
auth()->id()->orderBy('name')->pluck('name', 'id')->prepend('All Companies',
'');
}
```

Since our Company model only use SearchScope, we can also use withoutGlobalScopes without need to specify any scope class namespace.

```
public static function userCompanies()
{
    return self::withoutGlobalScopes()->where('user_id', auth()->id())-
>orderBy('name')->pluck('name', 'id')->prepend('All Companies', '');
}
```

Just in case you had other global scope in your Company model, then it's better to use `withoutGlobalScope` instead.
